INSIDE Current and emerging technologies in the field of biometric recognition

Published by the Institution of Engineering and Technology www.ietd.org/ICT-BMT

SPECIAL ISSUE ON: Unconstrained Ear Recognition

Motivation

Despite the numerous application possibilities in security, surveillance applications, forensics, criminal investigations or border control, the existing research in ear recognition has seldom gone beyond laboratory settings. This can mostly be attributed to the enormous appearance variability of ear images when captured in unconstrained settings. However, due to recent advances in computer vision, machine learning and artificial intelligence (e.g. with deep learning), many recognition problems are now solvable in unconstrained settings and many biometric modalities (including ear images) that were commonly too complex for real-life deployment are now becoming a viable source of data for identity recognition.

The goal of this Special Issue is to present the most advanced and up-to-date work related to unconstrained ear recognition, report recent findings and make fundamental and/or empirical contributions to the field. The Special Issue is meant to reflect the current state of technology in the area of ear recognition and serve as a reference for researchers working on problems relevant to ear-recognition technology.

Topics of interest

We solicit original high-quality papers on various topics related to ear recognition in unconstrained settings. Authors of submitted papers are requested to clearly explain how their work contributes to the field. Topics of interest include, but are not limited to:

- Pre-processing techniques for ear recognition
- Normalization techniques for ear recognition
- Ear recognition in unconstrained settings
- Ear detection/segmentation/localization techniques
- Ear recognition with different modalities (2D, 3D, IR, NIS, ear-prints, heterogeneous)
- Machine learning techniques for ear recognition
- Elimination of influence of covariate factors
- Context-aware ear recognition and detection
- Fusion techniques involving ear images
- Individuality models/studies for ear recognition
- Scalability studies for ear recognition technology
- New datasets and performance evaluations
- Overviews and surveys related to ear recognition
- Related applications (e.g., in forensics).

All papers must be submitted through the journal's Manuscript Central system:
<http://mc.manuscriptcentral.com/iet-bmt>

Publication Schedule:

Submission Deadline:

1 October 2017

Publication Date:

June 2018
